

Week of July 3 to July 9, 2026

Meeting report for Jordan: current dashboards and the Working Planet paid-ad attribution build.

For: Jordan **From:** Shela **Period:** July 3 to July 9, 2026 (ISO week 28) **Generated:** July 9, 2026

Biggest signal this week: **created accounts rose to 44 from 39 and demo-booking attribution is now built end to end for Working Planet.** July 2 to July 8 closed at **36.6K users** (up from 28.6K six days prior), **37.4K sessions**, **40.2K views**, **11 booked calls**, and a **89.9% bounce rate** that points back to the directory state entity pages. The main shipped work is three paid-ad attribution PRs: the demo page now passes UTMs into SavvyCal, the cookie window is extended to 30 days, and the SavvyCal-to-Close sync is in final review.

Executive Summary

- **Total Users:** 36.6K for the week, up from 28.6K six days ago.
- **Sessions:** 37.4K, with page views at 40.2K.
- **Created Accounts:** 44, up from 39 last week.
- **Booked Calls:** 11 for the window.

Highlights

- Paid-ad attribution for demo bookings is now built end to end for Working Planet across three PRs.
- Signup and free trial tracking is live in Close, writing Source = Paid Ads plus the UTM fields on Jordan's field IDs.
- Attribution cookie window extended from 1 day to 30 days to match Google's click window, fixing the paid-conversion undercounting.
- Created accounts rose to 44 from 39 and booked calls landed at 11, with weekly users at 36.6K.
- The SavvyCal-to-Close demo sync (PR #18) is in final review, pending merge, deploy, and one live Close test.

Dashboard Summary

- **Website Traffic** users surged to 36.6K from 28.6K six days ago with sessions at 37.4K and views at 40.2K, but bounce sits at 89.9%: the directory state entity page changes are still driving high-bounce volume, not engaged readers.
- **Conversions** moved the right way: created accounts rose to 44 from 39, and booked calls landed at 11.
- **Traffic Insights** confirms the split: /directory* pages bounce near 98% and the homepage at 75%, while blog organic search and the funnel pages (/dashboard, /login, /create-account) stay engaged below 50% and 10%.
- **Domain Rating** holds at 3.27/10 on the OpenPageRank scale, checked July 9, no change since the March 28 reading.
- **AI Visibility** 41.6% combined mention rate on the July 5 AEO run, 64 of 154 prompts cited across the engines, with 8 wins and 12 gaps.
- **AEO wins** stay strongest on Secretary of State API and Cobalt vs Midedesk prompts, with Perplexity leading at 35.7% and OpenAI at 24.0%; registered-business, Texas, and New York entity lookups remain the biggest gaps.
- **Newsletter** has steady above 50% open rate across the latest Beyond Banks editions.
- **YouTube** subscriber motion improved on the June 11 to July 8 Studio export: net -11 with 5 gained and 16 lost, better than last window's -15, alongside 2.6K views and 25.9 watch hours. Subscriber motion is still the number to push.

Completed This Week

Working Planet onboarding: paid-ad attribution shipped

DONE

- **Two small PRs finish paid-ad attribution for demo bookings**, the thing Working Planet asked about: PR #54 makes the demo page pass UTMs to SavvyCal in the metadata format it actually stores, already verified on staging with a real test booking; and PR #18, the SavvyCal-to-Close sync that writes the booking's UTM and paid fields to the matching Close lead, only filling empty fields so it never overwrites signup or Working Planet attribution.
- **One more PR for the same batch:** PR #76 extends the attribution cookie from 1 day to 30 days to match Google's click window. The 1-day expiry was undercounting paid conversions since B2B buyers rarely sign up same-day. Heads up that Paid Ads counts in Close will rise after this deploys, that is the undercounting being fixed.
- **All comments addressed, CI green on all three PRs:** #54 rebased onto master with a lockfile-only audit fix, 0 vulnerabilities now; #18 all 4 Copilot comments fixed, covering query escaping, a case-insensitive signature header, and timeouts on the Close calls; #76 now strips fragments before the cookie is written.
- **Told Working Planet that signup and free trial tracking is live:** last ad touch, stored in a first-party cookie, captures any utm_* value, click IDs like gclid and fbclid, or nb/brnd source values, and at signup writes Source = Paid Ads plus Paid Network, Paid Source, Paid Keyword, and the UTM fields to Close on the same field IDs Jordan shared.
- **Cleared the added Copilot rounds on the SavvyCal-to-Close sync #18;** CI is green and the Copilot review threads are resolved. PR #18 is ready for review, merge, and deploy.

In Progress

Working Planet onboarding: demo-booking sync deploy

IN PROGRESS

- **Checked the Working Planet attribution issue Sarah flagged:** the demo page UTM handoff into SavvyCal is working, but the SavvyCal-to-Close sync is not fully live yet. PR #18 is still open, and SavvyCal is showing 0 registered webhooks.
- **Still need the backend Function URL**, webhook registration, webhook secret setup, and one live Close test before demo booking UTMs will populate in Close.
- **The frontend demo-page PR #54 is already merged;** the backend sync #18 still shows open and review-required, and that is the piece that creates and deploys the sync and gives us the Function URL for webhook registration.

- **Follow-up for Jordan:** once #18 is deployed, send the Function URL so I can register the SavvyCal webhook and run the test booking to verify the Close fields.
