

Week of July 10 to July 16, 2026

Meeting report for Jordan: current dashboards and the Working Planet paid-ad attribution build.

For: Jordan **From:** Shela **Period:** July 10 to July 16, 2026 (ISO week 29) **Generated:** July 16, 2026

Biggest signal this week: **the SavvyCal to Close attribution sync is now deployed on the correct backend function, and Working Planet added an explicit Demo No Show status in Close.** Website volume dropped hard: July 9 to July 15 closed at **5.9K users**, down about 31.4K from six days prior as the directory state entity pages fell off, with **6.8K sessions**, **10.0K views**, **18 booked calls**, **31 created accounts**, and bounce easing to **57.4%**. The one remaining blocker is the SavvyCal webhook signature verification, which needs a code change before demo booking UTMs can populate Close.

Executive Summary

- **Total Users:** 5.9K for the week, down about 31.4K from six days ago.
- **Sessions:** 6.8K, with page views at 10.0K.
- **Created Accounts:** 31 for the window.
- **Booked Calls:** 18, up from 11 last week.

Highlights

- Website volume dropped to 5.9K users, down about 31.4K from six days ago, as the directory state entity pages keep falling off; bounce eased to 57.4%.
- The SavvyCal to Close UTM sync signature fix is now deployed on the correct backend function, with route, handler, and secrets all verified against AWS.
- Working Planet added an explicit Demo No Show status in Close, giving cleaner paid-lead quality visibility.
- Booked calls rose to 18 for the window with 31 created accounts.
- Remaining blocker: the SavvyCal webhook is rejecting every signed request at verification, so a signature scheme code change is queued behind Jordan's review, merge, deploy, and one live test booking.

Dashboard Summary

- **Website Traffic** is continuously going down due to the directory state entity page changes: users fell to 5.9K from about 37.2K six days ago, with sessions at 6.8K and views at 10.0K, though bounce eased to 57.4% as the high-bounce directory volume dropped off.
- **Conversions** held up against the volume drop: created accounts landed at 31 and booked calls rose to 18.
- **Traffic Insights** confirms the split: /directory* pages still bounce near 98% and the homepage at 75%, while blog organic search and the funnel pages (/dashboard, /login, /create-account) stay engaged below 50% and below 10%.
- **Domain Rating** holds at 3.27/10 on the OpenPageRank scale, checked July 16, no change since the March 28 reading.
- **AI Visibility** sits at 41.6% combined mention rate on the latest AEO run, 64 of 154 prompts cited across the engines, with 8 wins and 12 gaps.
- **AEO wins** stay strongest on Secretary of State API and Cobalt vs Midedesk prompts, with Perplexity leading and OpenAI second; registered-business, Texas, and New York entity lookups remain the biggest gaps.
- **Newsletter** has steady above 50% open rate across the latest Beyond Banks editions.
- **YouTube** subscriber motion is still the number to push: net -11 on the latest Studio export, 5 gained against 16 lost, alongside 2.6K views and 25.9 watch hours.

Close CRM Lead Quality

- **Paid-attributed leads:** 19 new paid-attributed leads this week out of 51 new leads total; the recent 30-day paid cohort is 71 leads, 6 of them carrying a Working Planet style paid source signal.
- **Opportunity conversion:** the recent paid cohort holds 23 opportunities, 4 of them new this week, with a type mix of 22 active and 1 won.
- **Opportunity status mix** (Patricia-maintained pipeline truth): 12 Demo No Show, 4 Demo Booked at 10%, 2 Post Demo Positive at 50%, 2 Post Demo negative at 5%, 1 Active Customer, 1 Initial Contact at 5%, and 1 Won at 100%.
- **Meetings:** 18 completed and 1 declined by lead, plus 1 possible no-show or stale meeting status; the explicit Demo No Show status Patricia added now shows on 12 opportunities.
- **Fit tagging** (Jordan's call fit/not-fit tag): 2 paid leads fit-tagged and 2 flagged Misfit, a bad-fit signal on paid spend.
- **Net signal:** 14 negative or lost opportunity signals against 4 positive or won, so the recent paid cohort is still tilting toward no-shows and bad fit rather than advancing opportunities.

Completed This Week

Infrastructure and Security: SavvyCal to Close UTM sync deploy verified DONE

- **Debugged the SavvyCal to Close UTM sync with Jordan and Loki** and confirmed the signature verification fix is now deployed on the correct backend function, after finding Jordan's earlier deploy had landed on the signup function instead.
- **Verified the API Gateway route, the handler wiring, and the Secrets Manager setup** all check out against AWS, so the plumbing for the sync is correct.
- **Documented the two-function deploy gotcha** so the signup path and the SavvyCal path do not get crossed again on the next deploy.
- **Net effect:** the SavvyCal side of the paid-ad attribution sync is now sitting on the right function with its route, handler, and secrets all verified, so the only piece left is the signature scheme itself.

Working Planet onboarding: Demo No Show status added in Close DONE

- **Patricia at Working Planet updated the Close opportunity field** to add a Demo No Show status: "We have updated the opportunity field to have Demo No show status. This will help with visibility on your end as well."
- **Close opportunities now carry an explicit Demo No Show status**, which gives cleaner paid-lead quality visibility on which booked demos actually show.
- **This lines up with the attribution work**: once demo booking UTMs populate in Close, we can tie no-show rate back to paid source per campaign.
- **For the meeting**: the headline is that Working Planet is now tagging no-shows for us, so the paid-lead pipeline in Close should read truer week over week.

In Progress

Working Planet attribution: SavvyCal webhook verification fix IN PROGRESS

- **Found the root cause of the remaining SavvyCal webhook 401s**: across 200-plus signed requests none ever passed verification, because SavvyCal signs its webhooks with a different signature scheme than the deployed verifier expects.
- **Re-copying the webhook secret will not fix it**; the signature verification needs a code change to match SavvyCal's actual signing scheme.
- **Practically, this is why paid demo bookings have not shown UTMs in Close yet**: the webhook is firing and reaching us, it is just being rejected at verification every time.
- **Opened a diagnostic change to log only the inbound header shape**, no secrets or signature bytes logged, addressed the review rounds, and CI is green; it is deliberately read-only so we can see what SavvyCal sends without touching verifier behavior yet.
- **Once this lands, the real verifier fix follows** and the sync can start writing demo booking UTMs into Close so paid demo attribution is finally captured end to end.
- **Follow-up for Jordan**: review and merge the diagnostic change, deploy it, and fire one real SavvyCal booking so we can confirm the header shape before the verifier fix ships.
